

## **Well Water Study for Breezy Meadows Subdivision Town of Enfield NY**

Wells in this area of Enfield find water in bedrock layer and generally run between 30 and 300 feet deep, with yields between 1 and 15 gallons per minute as the records indicate. Deeper isn't always better as the deeper you go the bigger chance of drilling into a salt layer. There are 2 areas of concern with water wells one is quantity and the other is quality of water; quality can be fixed through different water conditioning systems, so quantity is the main concern here. The New York State Health Department recommends 110 gallons of water per a bedroom per day, so a 4-bedroom house would use 440 gallons per day. A well yielding 0.5 gpm would supply 720 gallons per day, which is just shy of double what is needed for a 4-bedroom house. A residence with a low yielding well would need added storage for supply during high use times like mornings and evenings. See attached Individual water supply wells fact sheet #2

### **Current Wells in the area –**

I searched the well logs for the Town of Enfield on the NYS DEC web site there is a total of 209 well records listed for the town; 8 records did not list a yield for the well, it was left blank and only 4 were under 1 gpm. The other 197 wells shown in the records ranged from 1 – 48 gpm with depths from 35 – 320 feet, so 94% of the wells shown in the logs are definitely capable of supporting a single-family residence. See attached water well information.

The Town of Enfield recently compiled their own town water well study with 260 well records of individual well logs throughout the town. The wells shown in close proximity to our property range from 60 to 135 feet in depth and yield 4 to 15 gpm. There are 3 wells on the south side of Aiken Road in the proximity of Tucker Road that are all within 150 feet of each other with yields in the 4 to 6 gpm range. see attached maps.

I contacted Alan Teeter Code Enforcement Officer for the Town of Enfield he does not know of anyone in the Town of Enfield not being able to get water when building a new home.

### **Local well Drillers**

I reached out to several local well drillers to get their opinions on finding water in this area.

Utter Well Drilling - 8681 Lodi Center Rd, Lodi, NY 14860 I spoke to Jim Utter who said he drilled 10 wells over in the Enfield area last year and was very familiar with the property as a friend had stored cars in the barns on this property. He doesn't know of any problems finding water and doesn't believe there would be a problem finding water here. His only comment was you don't want to go to deep or you will hit salt, so he tries to stay under 200 feet and frack the well if it low yielding.

Randolph well and pump company - 41 Gulf Hill Rd, Cortland, NY 13045 NYRD 10080 has drilled quite a few wells in the Town of Enfield, the only 2 near our property that they could find in records were on Halseyville Road one was 2 gpm and the other 7 gpm. They did not know of any problems finding water in this area.

Berry Drilling - 7156 Curry Rd, Trumansburg, NY 14886 Berry Drilling has drilled a lot of wells in the town' I reached out to them 3 times and still haven't heard back.

### **Property History –**

This property was developed as a poultry farm in the early 1970 by the Babcock's; it was comprised of 13 chicken barns; 5 barns were 40' x 500' the other 8 barns were 40' x 350'. We obtained plans of the poultry farms water system showing 5 wells connected with a 20,000-gallon storage tank; well #1 is 6 gpm, well # 2 was abandon, well # 3 is 12 gpm, well # 4 is  $\frac{1}{2}$  gpm and well # 5 is 6 gpm. This 20,000-gallon water system substantially exceeds the daily water estimates of 14,520 gallons for all 33 proposed lots combined. See attached Babcock Poultry Farm Water Piping Layout

### **Water needs**

We estimate the proposed 33 lots all with 4-bedroom home would use approximately 14,520 gallons of water per day coming from 33 individual wells so each well would only need to produce 440 gallons a day. By having large lots with an average lot size of 10 acres spread across the entire 327 acres, individual wells will be spread out with water coming from 33 different wells not one or two high yielding well. A well yielding at least 1 gpm will supply 3 times the water necessary for a 4-bedroom residential house. The average lot frontage is 380 feet making the average minimum spacing between wells should be around 380 feet, so the zone of influence from one well to the next should not overlap with each other.

In the 25 years I have worked for New York Land and Lakes Development I have not seen one of our subdivisions with 100% built out. It is likely that a few buyers will buy more than one parcel or will just buy for investment later on. A few years ago we went back and did a study of our past projects and building rates in a 10 year period were only 23% of the parcels in a subdivision had a residence built on them. Using that stat in the next 10 years there will be 7 or 8 houses built out of the 33 parcels. This is further supported by a 43-lot subdivision done in 2019 by NY Land & Lakes in the nearby Town of Dryden; to date, only 4 of those lots have houses built on them.

### **Conclusion**

It appears the former poultry and swine farm operations located on this property in the 1970s and 1980s most likely used more water on a daily basis than the proposed 33 residential lots would. Based on interviews with local well drillers, Town code enforcement officer, existing well data for the wells on this property and well logs for the surrounding area; New York Land and Lakes Development feels there is more than sufficient water to serve 33 residential lots on this property by individual wells without having any negative effect on neighboring pre-existing wells located outside the subdivision.

# **Individual Water Supply Wells - Fact Sheet #2**

"[Water Storage](#)" is available in Portable Document Format (PDF).

## **Water Storage**

A drinking water well capable of providing a sufficient quantity of water is indispensable for homes that are not served by a public water system. Low yielding wells may be able to provide sufficient quantity for daily use, yet be unable to meet peak demand. Supplemental water storage can allow low yield wells to meet peak water use demand.

## **Well Yield, Water Demand, and Storage**

Well yield is a sustainable rate of water flow, usually expressed in gallons per minute (gpm), that a well can draw continuously over an extended period. The Department's well construction standards, Appendix 5-B of 10 NYCRR Subpart 5-1, require that all new, replacement, and redeveloped drinking water wells be tested for yield.

*Daily* water usage can be estimated for typical households based on the number of occupants or bedrooms. A household with moderate water use will typically need 110 gallons of water per day per bedroom. This number, however, does not take into account extra water needed for homes with high occupancy, lawn irrigation, spa tubs, and other activities and plumbing fixtures that have a high water demand. Higher water use activities and fixtures are not recommended for homes served by low yield wells.

*Peak* residential water demand typically occurs in the morning and evening when more than one water use is occurring. Peak demand can vary greatly based on the number of simultaneous water uses, the flow rates of individual water fixtures, and the length of time fixtures operate. 5 gpm (two fixtures running simultaneously at 2.5 gpm) is a good estimate of peak demand, for the typical household. Water wells that reliably yield 5 gpm should be able to meet peak and daily needs for most residences.

Wells yielding less than 5 gpm, however, are sometimes the only water source available. These lower yield wells can often meet the total daily water demand, but may not be able to satisfy a household's peak demand. Incorporating supplemental water storage into a household water system can allow low yielding wells to meet both daily household and peak demand. This can prevent low pressure and inadequate water flow when multiple fixtures are in use, reducing the need to schedule showers, laundry, and other water uses for inconvenient times.

## **Steps in Determining Supplemental Storage Needs**

1. Determine the yield of the well. An accurate yield test is essential for evaluating storage. Water well drillers are required to follow Appendix 5-B when determining well yield.
2. If the well yield is less than 5 gpm the table on the reverse can be used to select the amount of supplemental storage needed for households with typical moderate water use.

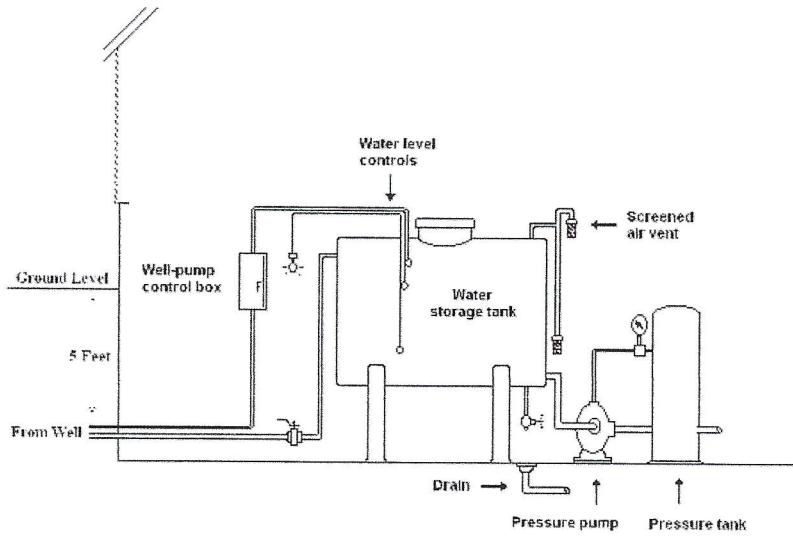

3. Sufficient storage can be provided by a storage tank. A storage tank may be reduced in size, however, or may not be necessary if sufficient storage is available within the well itself. The typical 6-inch diameter well will hold approximately 1.5 gallons of water per foot of casing. The height of the water above the pump when it is not operating, multiplied by the gallons of water per foot of casing approximates the amount of available storage within the well casing. Shallow wells and wells with slow recovery may not contain reliable storage and caution is advised when considering their potential for storage capacity.
4. Water well professionals should be consulted for advice on selecting storage for households where water use is higher than at typical households, and when storage in the well casing is being considered. A list of registered water well drillers can be found at <http://www.dec.ny.gov/lands/4997.html>.

### **Storage Recommendations**

A well for a private residence should, if possible, be constructed to produce a minimum long-term sustainable yield of 5 gpm or more. Where this can not be achieved, the following table can be used to help select water storage that will allow low yield wells to meet peak household water demand. This storage can be provided by a tank, storage in the well, or a combination of both.

Recommended Minimum Storage (Gallons)		Number of Bedrooms		
Well Yield (GPM)	2	3	4	5
≥ 5	None			
3 to 5	100	150	200	250
1 to 3	150	200	250	300
0.5 to 1	200	250		
< 0.5	Not recommended for use			

**Diagram of a typical water tank, providing supplemental storage for a well water system.**
